4. 2025/0047/BE - S00E - ENVIRONMENT

5. Ministerial Decree establishing the standard procedure for descriptive soil investigation under the Soil

Decree of 27 October 2006

6. Conducting descriptive soil investigation. BBO is carried out to determine the severity of soil contamination. It provides a description of the type, nature, quantity, origin, and extent of pollutants, possible distribution...

7.

8. The Soil Decree of 27 October 2006 (Article 38(2)) provides that a descriptive soil investigation is carried out under the direction of a soil remediation expert in accordance with the standard procedure laid down by the Flemish Government on a proposal from the OVAM. A report of the descriptive soil investigation is drawn up and submitted to the OVAM by the soil remediation expert, in accordance with the aforementioned standard procedure. In Article 7 of the VLAREBO Decree of 14 December 2007, the Flemish Government delegated the adoption of the standard procedure for descriptive soil testing to the Flemish Environment Minister. The Decree of the Flemish Environment Minister notified with this notification message establishes the aforementioned standard procedure.

The standard procedure for descriptive soil investigation specifies the procedure for conducting a descriptive soil investigation based on binding, guiding, and advisory elements regarding the implementation (including preliminary study, source determination, determination of research strategy and implementation, risk assessment, and assessment of the need for soil remediation) and the reporting and data transfer.

9. The notified Ministerial Decree with the established standard procedure aims to ensure the qualitative and objective performance of a descriptive soil survey led by recognised soil remediation experts. The standard procedure for descriptive soil investigation is a guide for the recognised soil remediation experts to carry out the descriptive soil investigation in a systematic and careful manner: examination of the identified soil contamination (type, nature, quantity, concentration, origin and extent of the pollutants or organisms), risk analysis of the identified soil contamination (the potential for its spread and the risk of exposure to humans, plants and animals and to ground and surface water), assessment of the need for soil remediation, and reporting of the findings and assessments in a descriptive soil investigation report.
